

PolyEdge

Premium Crypto Signal Analytics Dashboard

A comprehensive trading analytics platform providing real-time signal intelligence, model validation, and AI-powered insights for BTC, ETH, SOL and XRP 15-minute markets.

User Guide v1.0 · August 2026 · 19 Features Annotated

Table of Contents

1	Live Signal Cards BTC/ETH/SOL/XRP with confidence rings, countdown and AI Analysis	2	Session Traction Win rate, P&L, open trades, max drawdown summary
3	Key Metrics Row Best trade, worst trade, win streak, max drawdown callouts	4	Equity Curve Simulated capital growth over 220 resolved signals
5	Confidence vs Win-Rate Scatter validating signal quality per confidence tier	6	Entry Timing PnL Best entry-time buckets by average return
7	Asset Performance Horizontal bar chart — BTC/ETH/SOL/XRP win rates	8	Rolling Win Rate 10-trade window with 50% and 70% reference lines
9	Calibration Chart Predicted confidence vs actual realised win rate	10	Benchmark Chart Strategy vs HODL BTC with Alpha badge
11	PnL Distribution Histogram across 6 colour-coded return buckets	12	Hourly Heatmap 24-cell UTC grid showing peak performance windows
13	Kelly Calculator Half-Kelly dial for optimal position sizing	14	AI Session Digest Streaming narrative from qwen3-max via LiteLLM
15	Live Market Data Binance WebSocket prices + liquidity heatmap	16	Export Trades CSV One-click export of all resolved signals

Feature Reference & How-To Guide

Live Signal Cards

Refresh every second via Crypto15mSignalEngine. The confidence ring fills as model certainty increases. Urgent signals (under 5 min) glow red. Click "AI Analysis" to stream a real-time LLM explanation.

Session Traction

Computed from all resolved trades stored in LocalStorage. Resets when you clear signals. Shows Win %, Avg PnL per trade, open positions count, and worst drawdown observed this session.

Equity Curve

Starts at \$10,000 and compounds at each resolved outcome. Y-axis anchors to data range so even 1% moves are clearly visible. Hover any point for exact capital value.

Calibration Chart

Well-calibrated signals sit on the diagonal. Bars above = overconfident model; below = under-confident. Use this to decide when to trust high-confidence tier signals.

Kelly Calculator

Win rate and win/loss ratio are derived automatically from your last 50 resolved signals. Output is half-Kelly stake as % of bankroll. Gradient risk bar turns amber above 15%, red above 25%.

AI Session Digest

Bundles last 50 signals into a structured prompt and streams back a 3-sentence narrative highlighting patterns, risk events and opportunities via Server-Sent Events from qwen3-max.

Hourly Heatmap

All 24 UTC hours rendered as colour-coded cells. Green = high win rate, amber = moderate, red = historically poor. Peak hour badge shown top-right for quick reference.

Benchmark Chart

Both curves start at 100 at session open. Alpha = strategy return minus BTC return. Green badge means you are outperforming passive HODL; red means under-performing.

Export Trades CSV

Exports all LocalStorage signals as UTF-8 CSV. Columns include asset, direction, confidence, entry time, resolve time, PnL %, and outcome. Compatible with Excel and Google Sheets.
